1975

## *In this report:*

	Table
SAMPLING ERRORS	1,61-64
FOREST RESOURCE CHANGE	2,30
FOREST AREA IN—	
—acres	3-8,33-37
—hectares	58
GROWING STOCK IN—	
—cords	9,38
—cubic feet	10,13,14,17,18,21-24,31, 39,42,44,46-48,55,56
—cubic meters	59,60
SAWTIMBER IN—	
—International 1/4-inch rule	11,12,15,16,19,20,32, 40,41,43,45,55,57
NET ANNUAL GROWTH	25,26,49,50,57
TIMBER REMOVALS	27,28,51,52
MORTALITY	29,53,54

## *Acknowledgments*

Generous assistance from public and private organizations made it possible to keep the field work for the latest forest inventory of Louisiana ahead of the schedule that could have been maintained with regularly allotted funds. The very material aid of the organizations listed below, and of the individuals in them, is gratefully acknowledged:

*Forest resource regions in Louisiana.*

# Forest Statistics for Louisiana Parishes

This report tabulates information from a new forest survey of Louisiana, completed in 1974 by the Forest Resources Research Unit of the Southern Forest Experiment Station. The tables are intended for use as source data in compiling estimates for groups of parishes. Because the sampling procedure is designed primarily to furnish inventory data for the State as a whole, estimates for individual parishes have limited and variable accuracy.

The data on forest acreage and timber volume were secured by a systematic sampling method involving a forest-nonforest classification on aerial photographs and on-the-ground measurements of trees at sample locations. The sample locations were at the intersections of a grid of lines spaced 3 miles apart. At each forested location, 10 small plots were uniformly distributed on an area of about 1 acre.

The sampling errors to which the State area and volume totals are liable (on a probability of two chances out of three) are shown in table 1.

TABLE 1.—*Sampling errors for forest land and volume estimates*

Item	Sampling error
— — — Percent — — —	
Commercial forest land	0.3
Growing-stock volume	1.5
Sawtimber volume <sup>1</sup>	1.9
Growth on growing stock	1.6
Growth on sawtimber <sup>1</sup>	2.1

<sup>1</sup> International ¼-inch rule.

Detailed sampling errors are shown in tables 61-64. An approximation of sampling errors for groups of parishes may be obtained by using the formula:

$$e = \frac{(SE) \sqrt{\text{specified volume or area}}}{\sqrt{\text{volume or area total in question}}}$$

Where: e—Estimated sampling error of the volume or area total in question

SE—Specified sampling error for the State.

The error decreases when data for two or more parishes are grouped. Conversely, as data for individual parishes are broken down by various subdivisions, the possibility of error increases and is greatest for the smallest items.

Because of differences in standards of tree measurement, direct comparisons cannot be made between the estimates in this report and those from the survey of 1964. In table 2, changes between the two surveys are summarized in terms of current measurement standards.

## DEFINITIONS OF TERMS

**Acceptable trees.**—Growing-stock trees of commercial species that meet specified standards of size and quality but do not qualify as desirable trees.

**Commercial forest land.**—Forest land producing or capable of producing crops of industrial wood and not withdrawn from timber utilization.

TABLE 2.—Commercial forest land, growing-stock, and sawtimber volume, 1974, and change since 1964

Resource region	Commercial forest		Growing stock				Sawtimber			
	Area	Change	Softwood		Hardwood		Softwood		Hardwood	
			Volume	Change <sup>1</sup>						
	<i>Thousand acres</i>	<i>Percent</i>	<i>Million cu. ft.</i>	<i>Percent</i>	<i>Million cu. ft.</i>	<i>Percent</i>	<i>Million bd. ft.</i>	<i>Percent</i>	<i>Million bd. ft.</i>	<i>Percent</i>
Delta	3,751.5	-19	1,172.9	+18	3,409.5	-16	4,878.6	+16	11,083.3	-18
Northwest	4,450.4	-5	3,343.7	+37	1,872.3	+7	13,754.5	+38	5,548.5	+4
Southwest	4,538.4	-6	3,339.0	+40	1,642.3	+1	13,378.1	+33	5,086.6	( <sup>2</sup> )
Southeast	1,786.3	-5	1,184.4	+10	733.4	-6	4,981.5	+9	2,104.3	-8
All regions	14,526.6	-9	9,040.0	+31	7,657.5	-7	36,992.7	+29	23,822.7	-9

<sup>1</sup> Based on current measurement standards.

<sup>2</sup> Negligible.

**Desirable trees.**—Growing-stock trees that are of commercial species, have no defects in quality for timber products, are of relatively high vigor, and contain no pathogens that may result in death or serious deterioration before rotation age.

**Forest type.**—A classification of forest land based upon the species forming a plurality of live-tree stocking.

**Growing-stock trees.**—Live trees that are of commercial species and qualify as desirable or acceptable trees.

**Growing-stock volume.**—Net volume in cubic feet of growing-stock trees at least 5.0 inches in diameter at breast height, from a 1-foot stump to a minimum of 4.0-inch top diameter outside bark of the central stem, or to the point where the central stem breaks into limbs.

**Mortality.**—Sound-wood volume of live trees dying from natural causes during a specified period.

**Net annual growth.**—The increase in volume of a specified size class for a specific year.

**Noncommercial species.**—Tree species of typically small size, poor form, or inferior quality which normally do not develop into trees suitable for industrial wood products.

**Physiographic site.**—A classification of forest land according to its suitability for growing certain species groups—pines, upland hardwoods, or bottom land hardwoods.

**Poletimber trees.**—Growing-stock trees of commercial species at least 5.0 inches in diameter at breast height but smaller than sawtimber size.

**Rotten trees.**—Live trees of commercial species that do not contain at least one 12-foot saw log, now or prospectively, primarily because of rot.

**Rough trees.**—Live trees of commercial species that do not contain at least one 12-foot saw log, now or prospectively, primarily because of roughness or poor form. (Includes all live trees of noncommercial species.)

**Sawtimber trees.**—Live trees that are of commercial species, contain at least a 12-foot saw log, and meet regional specifications for freedom from defect. Softwoods must be at least 9.0 inches in diameter at breast height and hardwoods at least 11.0 inches.

**Sawtimber volume.**—Net volume of the saw-log portion of live sawtimber trees in board feet, International 1/4-inch rule.

**Site class.**—A classification of forest land in terms of inherent capacity to grow crops of industrial wood.

**Stand-size class.**—A classification of forest land based on the size class of growing-stock trees on the area; timber is, sawtimber, poletimber, or sapling and seedling.

**Timber removals.**—The net volume of growing-stock trees removed from the inventory by harvesting, cultural operations such as timber-stand improvement, logging, clearing, or changes in land use.

Table 3. Total area, commercial forest land, and proportion of total area, 1974, and change since 1964
